

Patient categories by the rate of excursions to >120% and <80% of the reference (n/10 min)

**Supplementary Figure 1.** Rates of blood pressure excursions during endovascular procedure to >120% or to <80% of the reference. Patients are classified by the rate of episodes (n/10 minutes) to <80% as those with none, up to 1 and >1 episode/10 minutes, while actual rates are given on the y-axis: rates to >120% of the reference (upper panel) and to <80% of the reference (lower panel). Dots are individual data, shaded bars illustrate frequency of rates and numbers are counts of patients with no excursions to >120% of the reference.
