

Supplementary Figure 3. Bland-Altman plots between estimated infarct using the software and ground truth infarct stratified by last known well (LKW) to image. (A) Patients with diffusion-weighted imaging (DWI) $< 6\text{ h}$ after the LKW. (B) Patients with DWI between 6 and 24 h after LKW. (C) Patients with DWI findings $> 24\text{ h}$ after LKW. The green and black dotted lines indicate the mean percentage difference and 95% limit, respectively. If the software did not find an infarct, the percentage difference was calculated as 200%.
